Vaccine
Institute

Topics

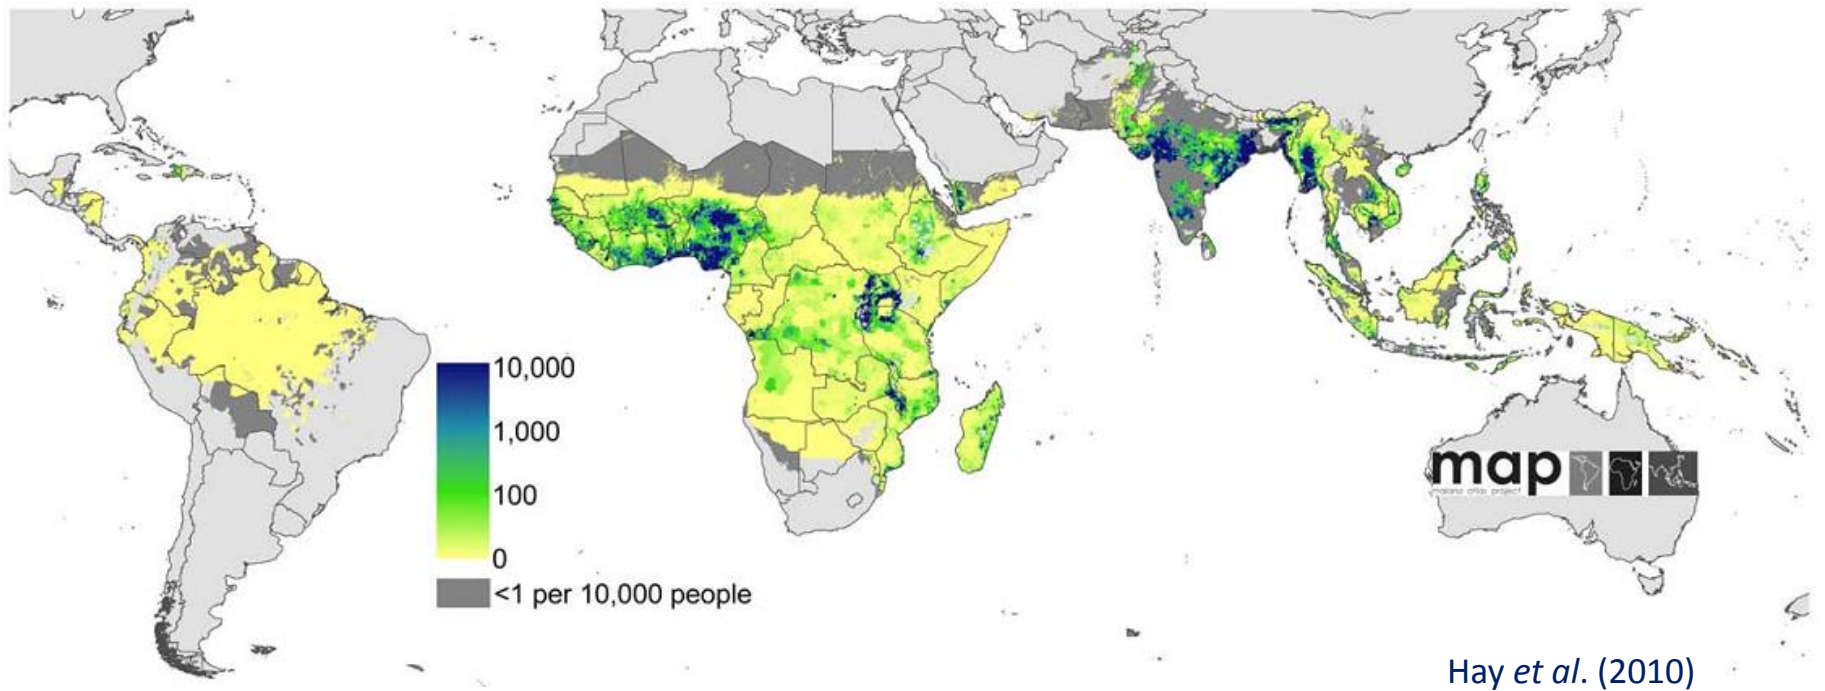

- Examples of disease burden maps
- Generating maps
- Mapping the burden of typhoid fever: model and input
- Typhoid occurrence and explanatory covariates
- Boosted regression tree model
- African map of probability of occurrence and annual incidence rate of typhoid fever

Example: probability of dengue occurrence

Bhatt *et al.* (2013)

Example: incidence of malaria transmission

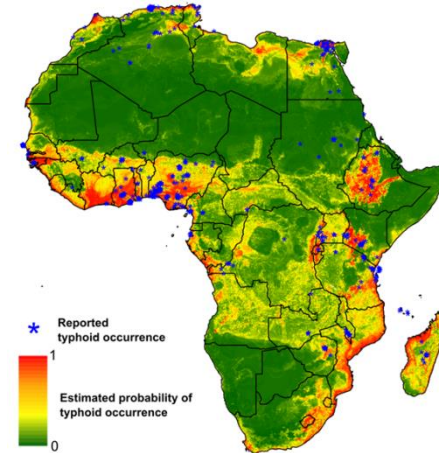

Mapping the burden of a disease

Disease occurrence points

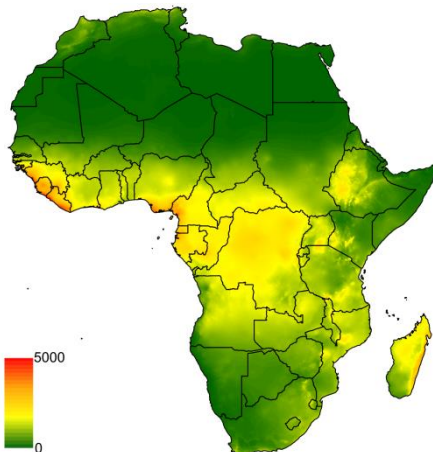

Predicted probability of occurrence

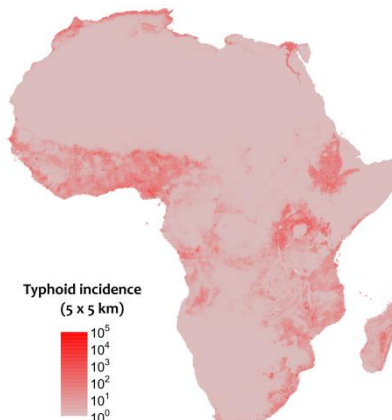

Model

Geospatial covariates

Predicted incidence rate

Mapping the burden of typhoid fever

- Data

- Geo-referenced typhoid fever occurrence
- Geo-referenced variables that potentially have influence on typhoid transmission

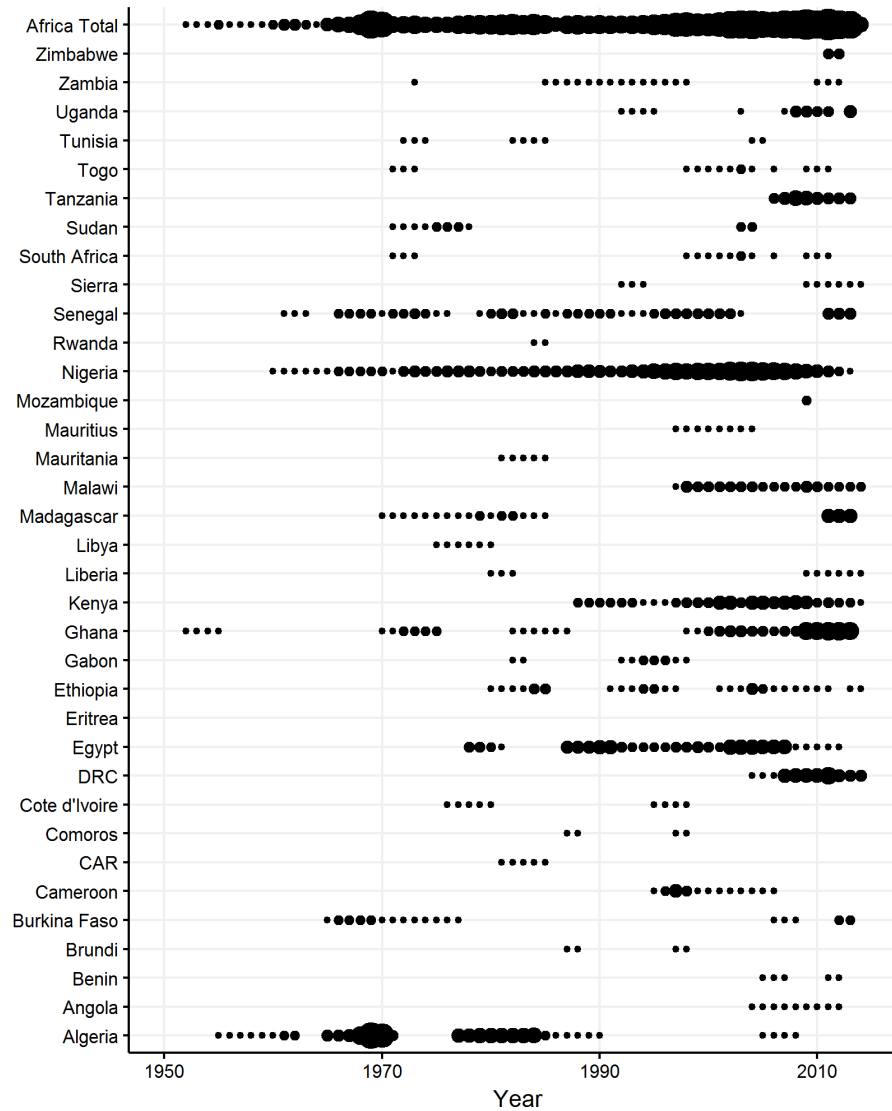

- Model

- Boosted regression trees and Bayesian hierarchical model

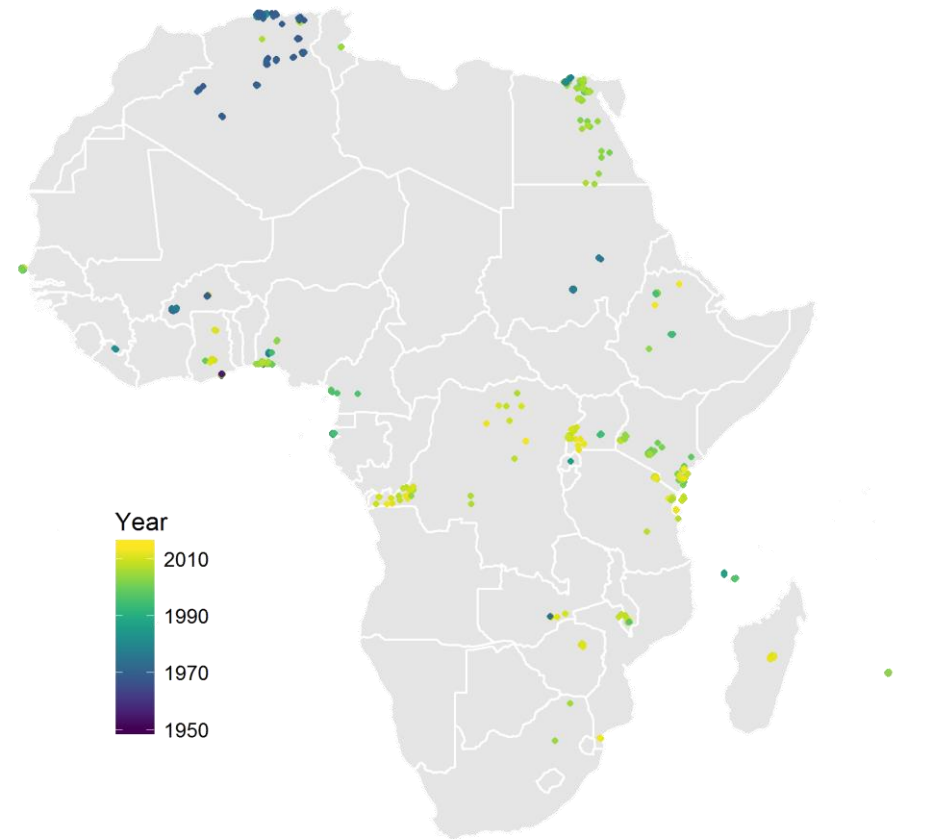

Identification of typhoid occurrence

- Review of records (PubMed, Embase, and ProMED)
- Blood culture confirmed typhoid fever
- Geographic coordinates using Google Maps
- The period of 1950-2015
- Typhoid occurrence standardized by year

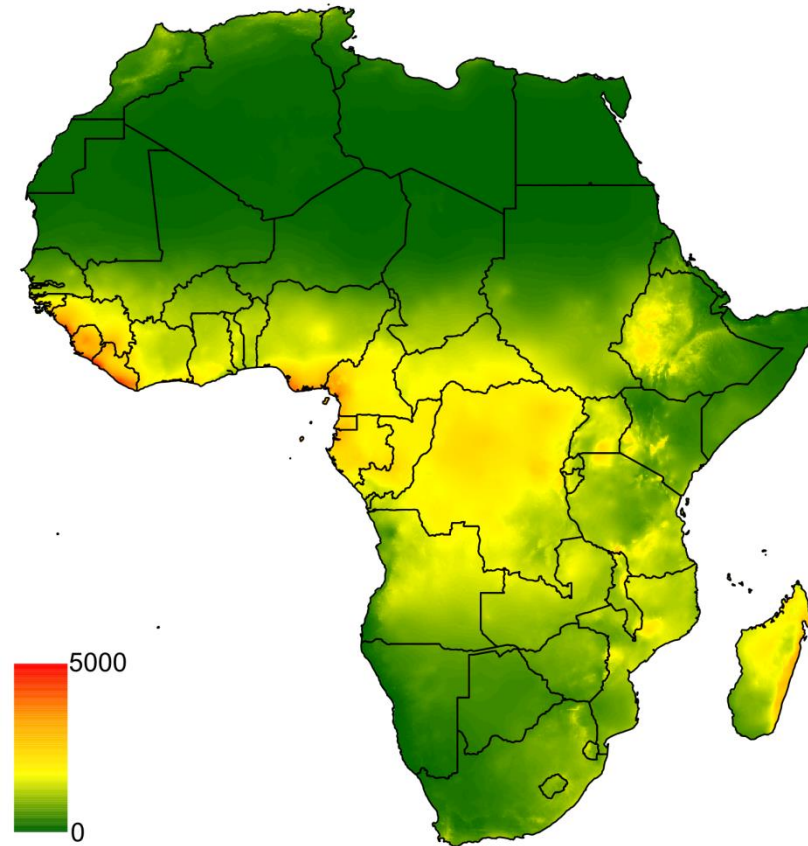

Typhoid reports by country and year

Blood culture confirmed typhoid (n=688)

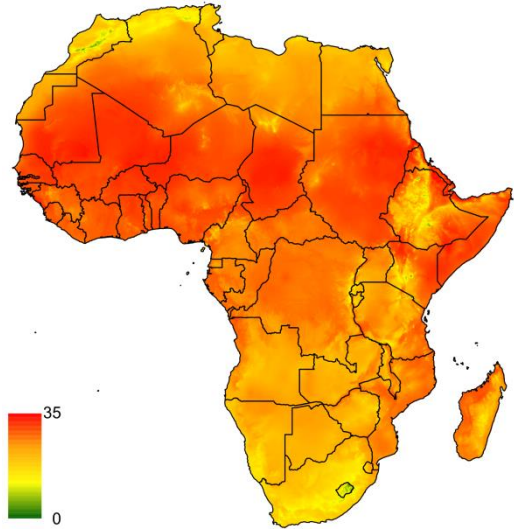

Explanatory covariate: annual precipitation

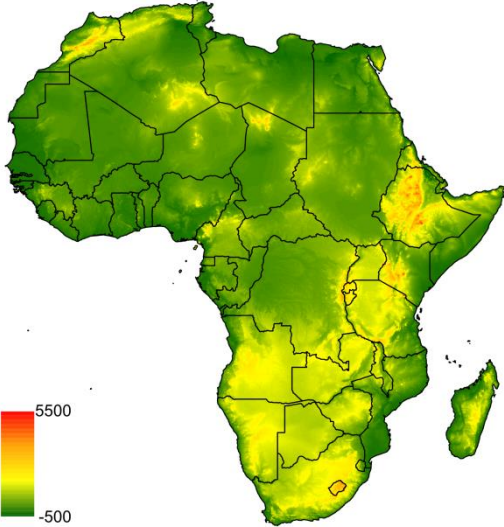

Additional covariates

Annual mean temperature

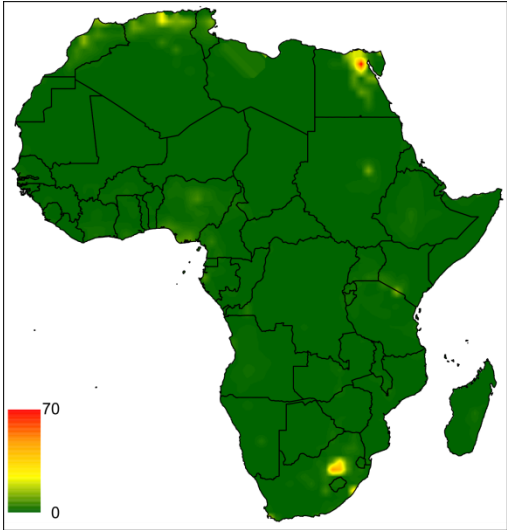

Altitude

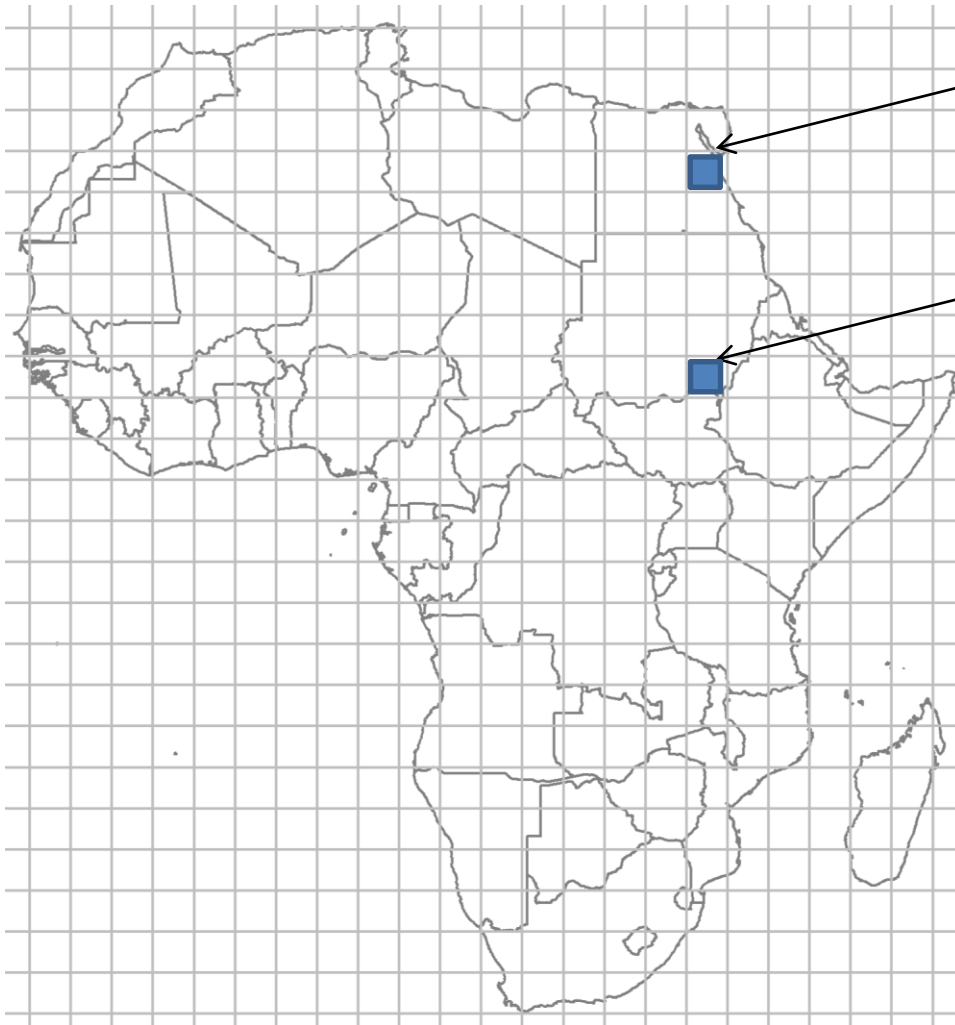

Travel time to the nearest settlement of 100,000 people

Gross cell product

Model inputs

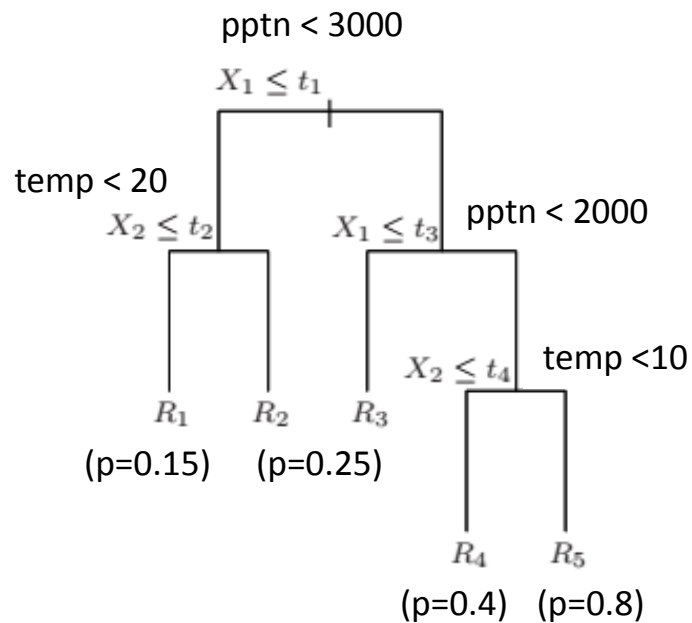

Cell#	TF?	pptn	temp	alt	...
56	YES	1500	10	5	

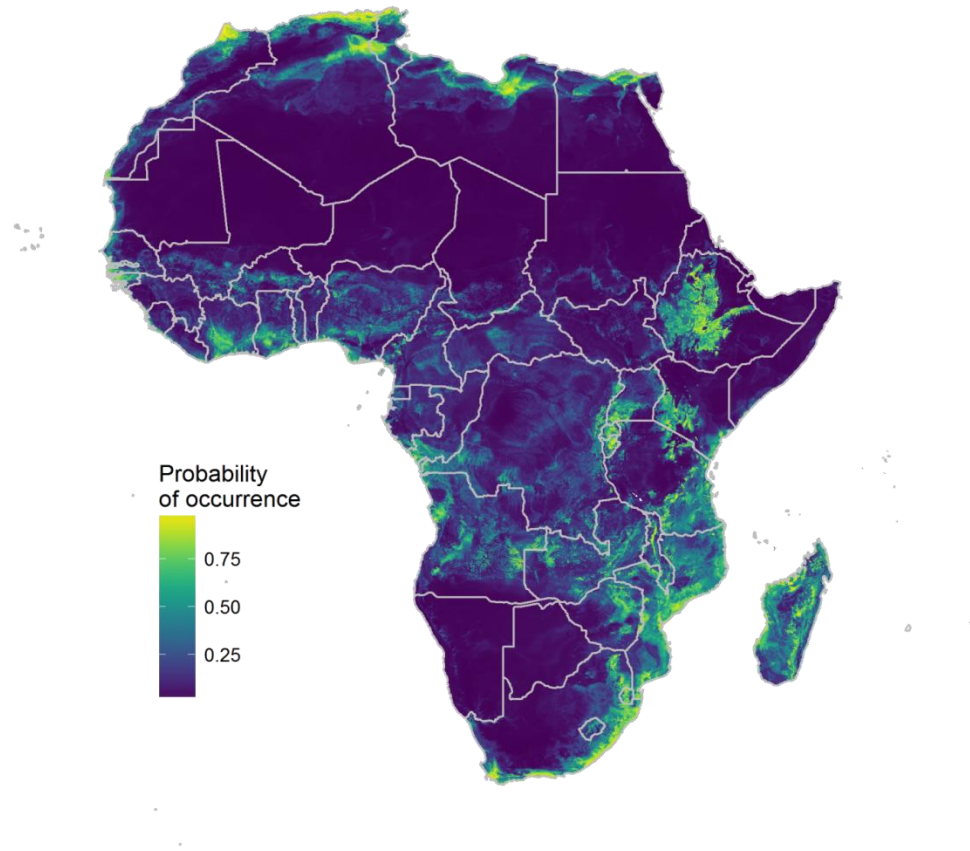

Cell#	TF?	pptn	temp	alt	...
180	NA	500	89	5	

Boosted regression tree (BRT) model

An ensemble of (weak) decision tree

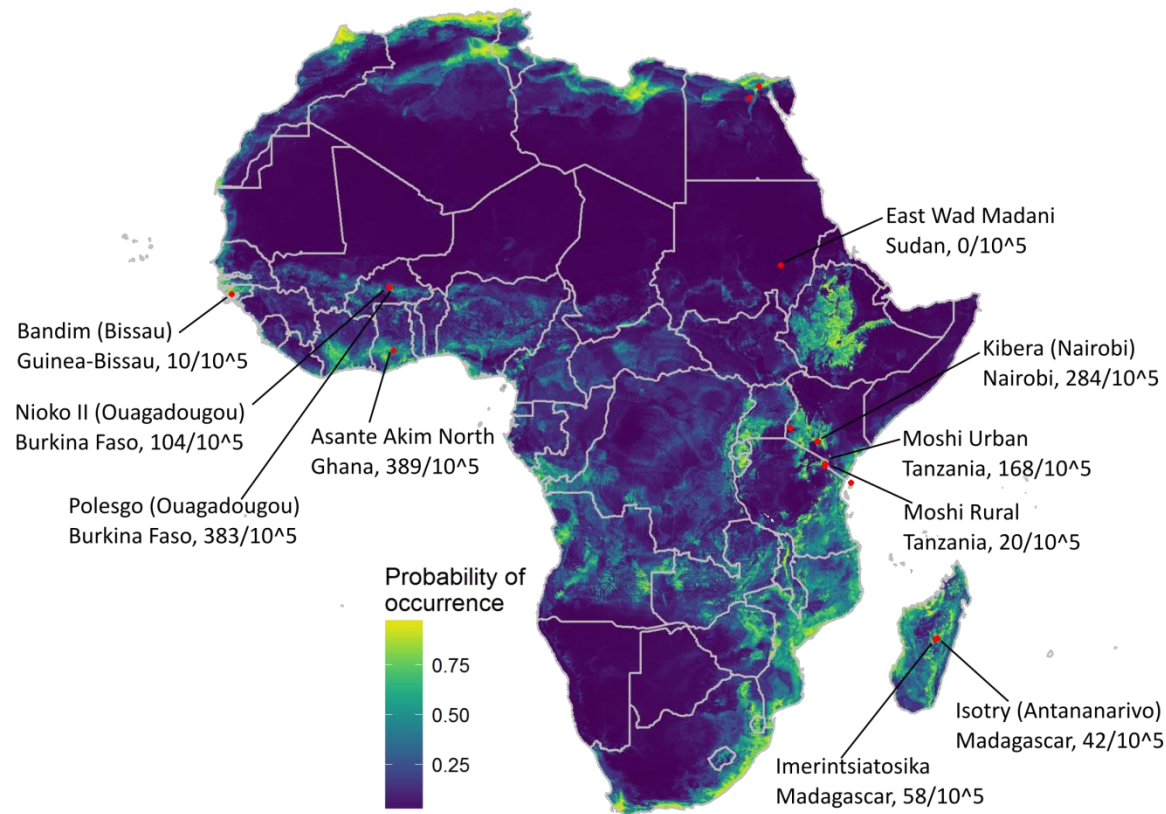

Predicted probability of typhoid occurrence

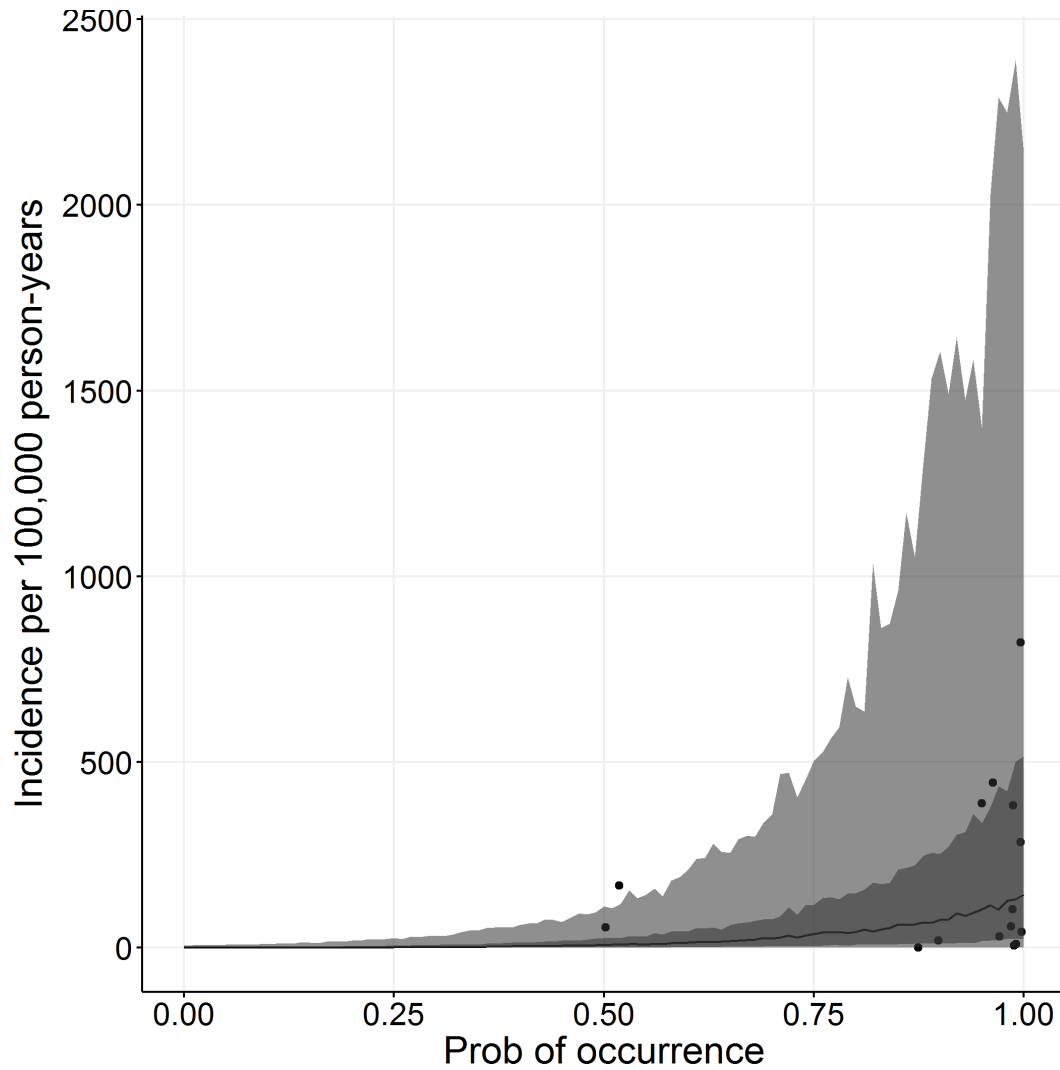

The prediction model evaluation via 10-fold cross validation

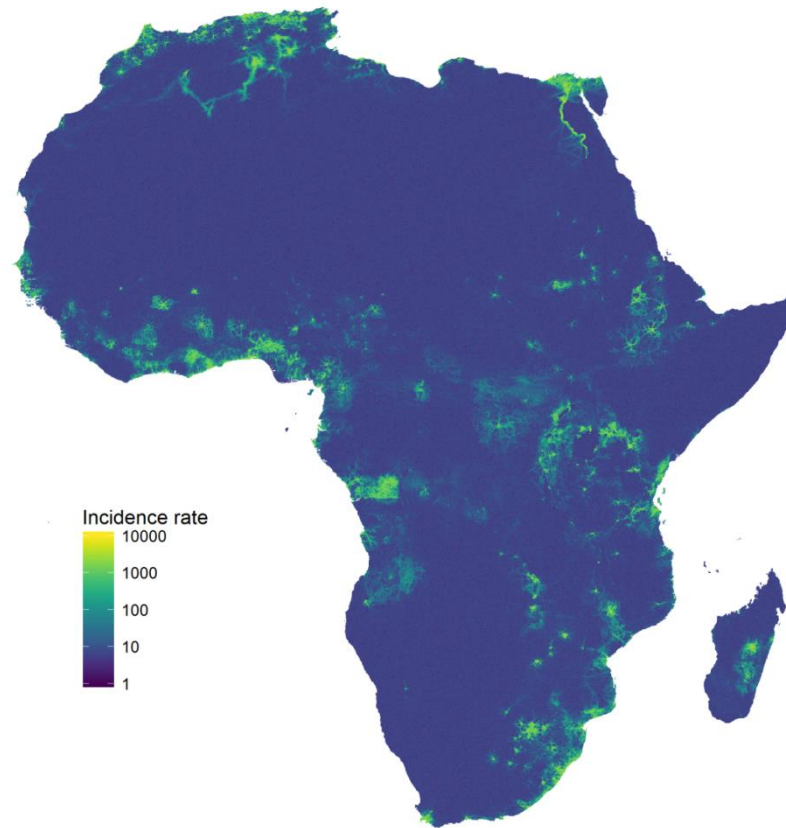

Predicted probability of typhoid occurrence overlaid with surveillance sites

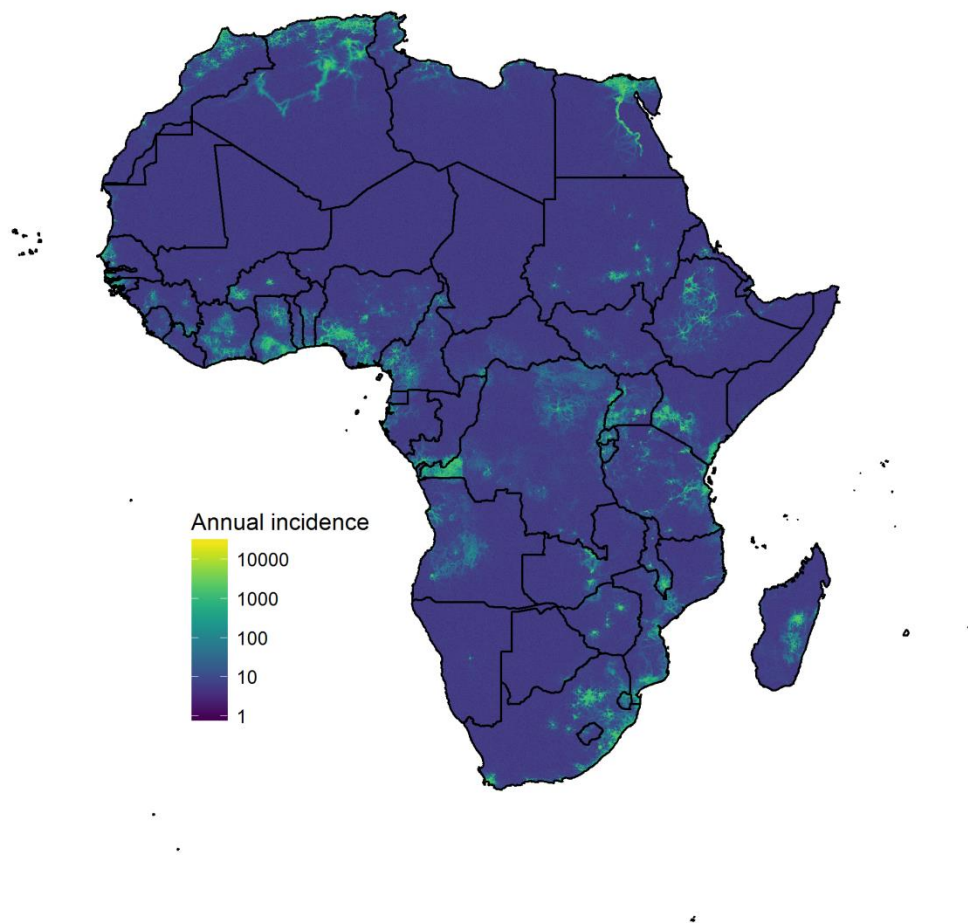

Incidence rate vs. probability of occurrence

Typhoid incidence rate in Africa (5 x 5 km)

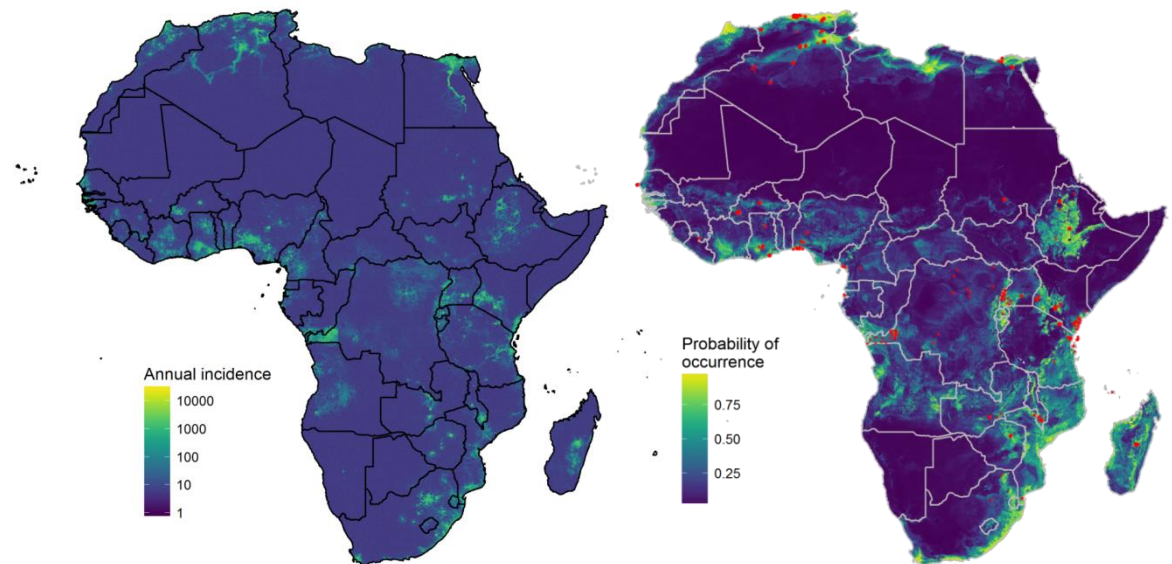

Annual incidence of typhoid in Africa (5 x 5 km)

Conclusion

- High-resolution (5 x 5 km) maps on the probability of occurrence and incidence rate of typhoid fever
- There appears to be a significant spatial heterogeneity in burden of typhoid fever
- More relevant covariates (e.g., access to clean water) synthesized and tested for the model

Annual incidence of typhoid in Africa by country

Partial dependency plots

Number of typhoid cases since 1950

Future work – Explanatory covariates

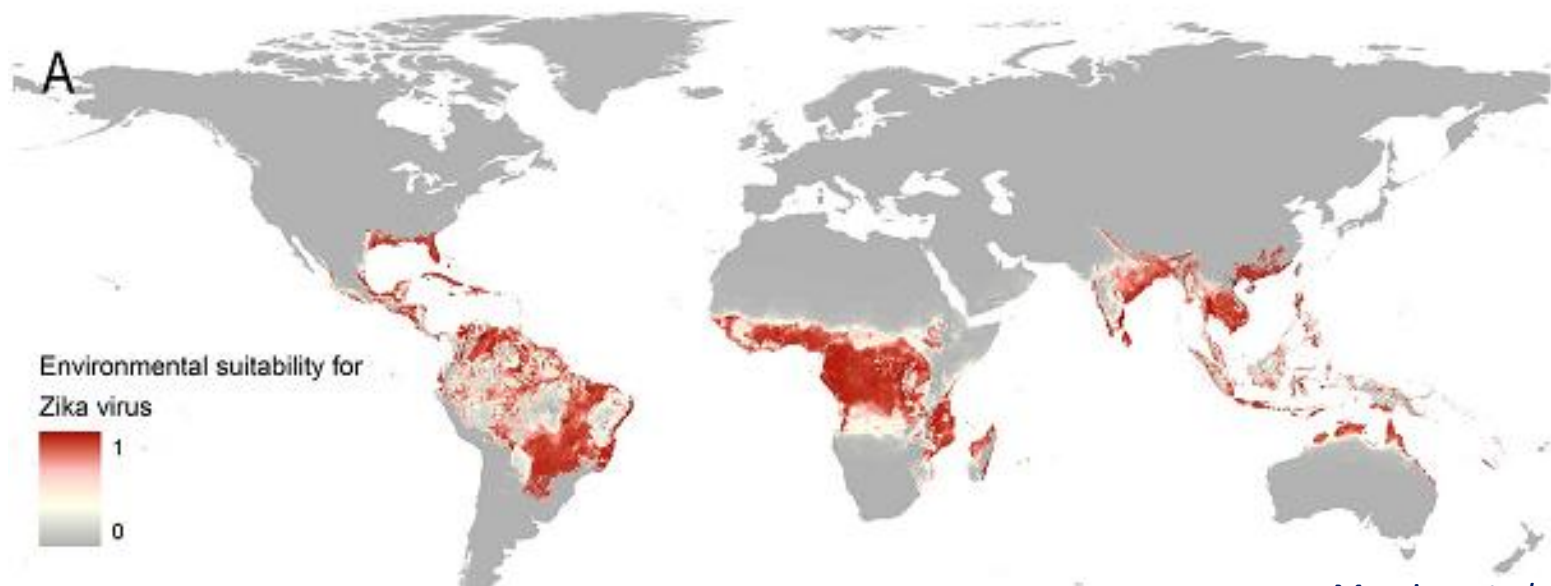

Percent Urban, Temperature, Vegetation, Population density, Rainfall, vapour pressure, agricultural land (percentage of), forested land, Increasing age, Age 12 years or younger

Variables that can be mapped across Africa – data available

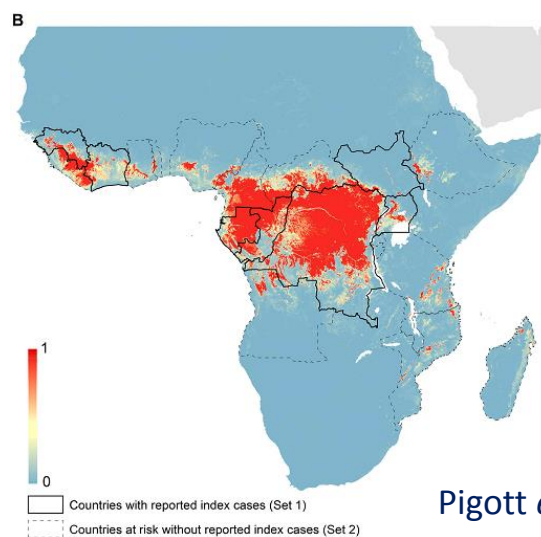

Total literacy rate, Housing density, Percent slum, House with open sewers, No water supply from municipal network, No toilet in the household, low income, owning mobile phone, Community latrine, Refrigerator in the home

Variables that can be mapped across Africa – data to be retrieved

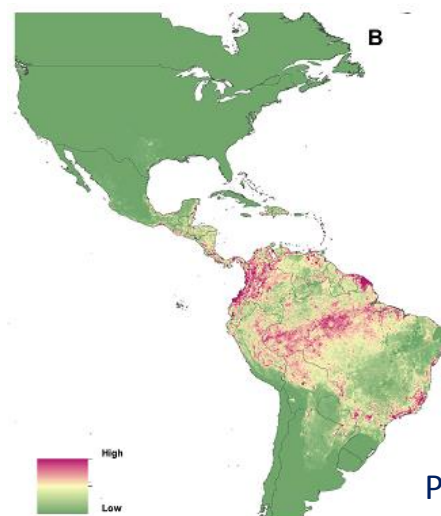

Many others: ZIKV, EBVD, Leishmaniases , ...

Messina *et al.* (2016)

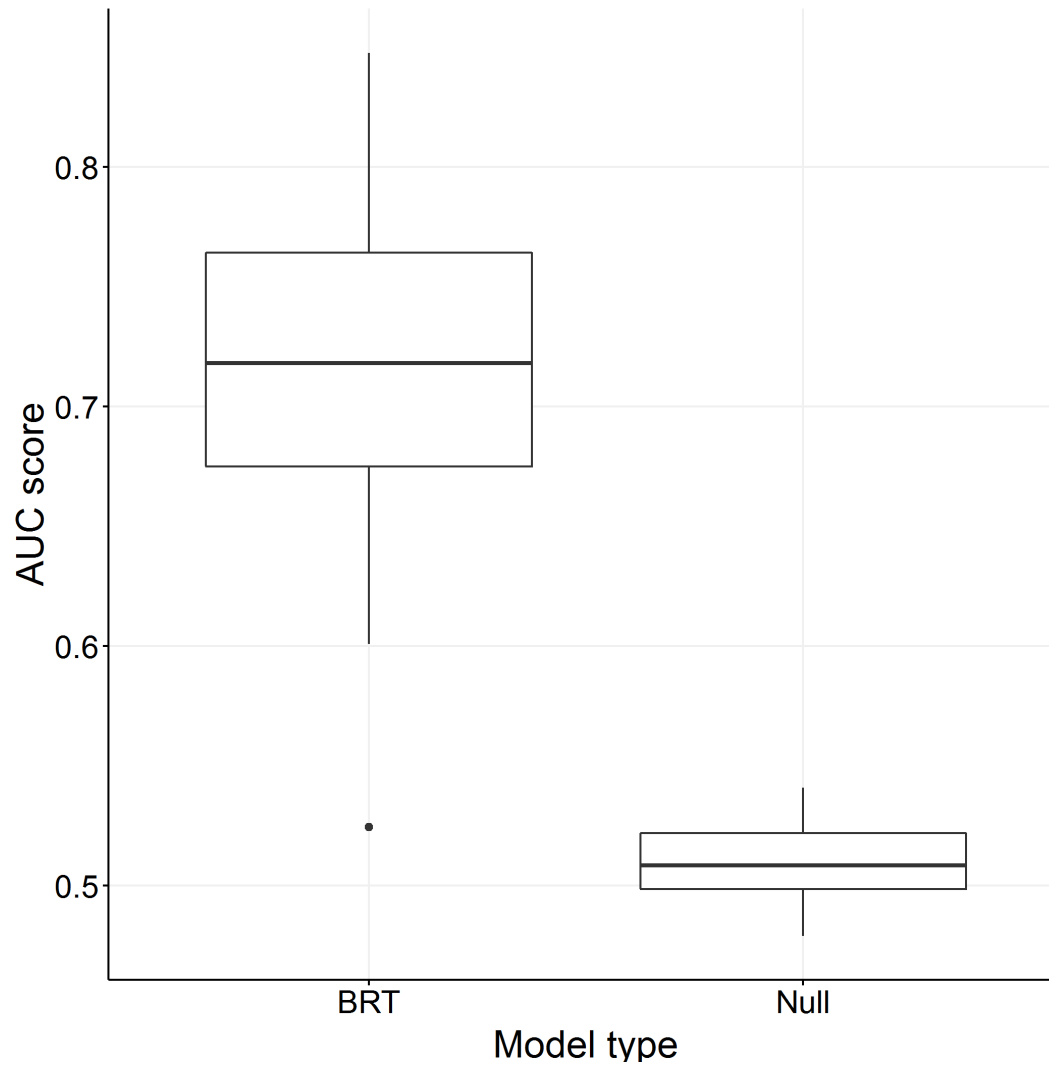

Pigott *et al.* (2016)

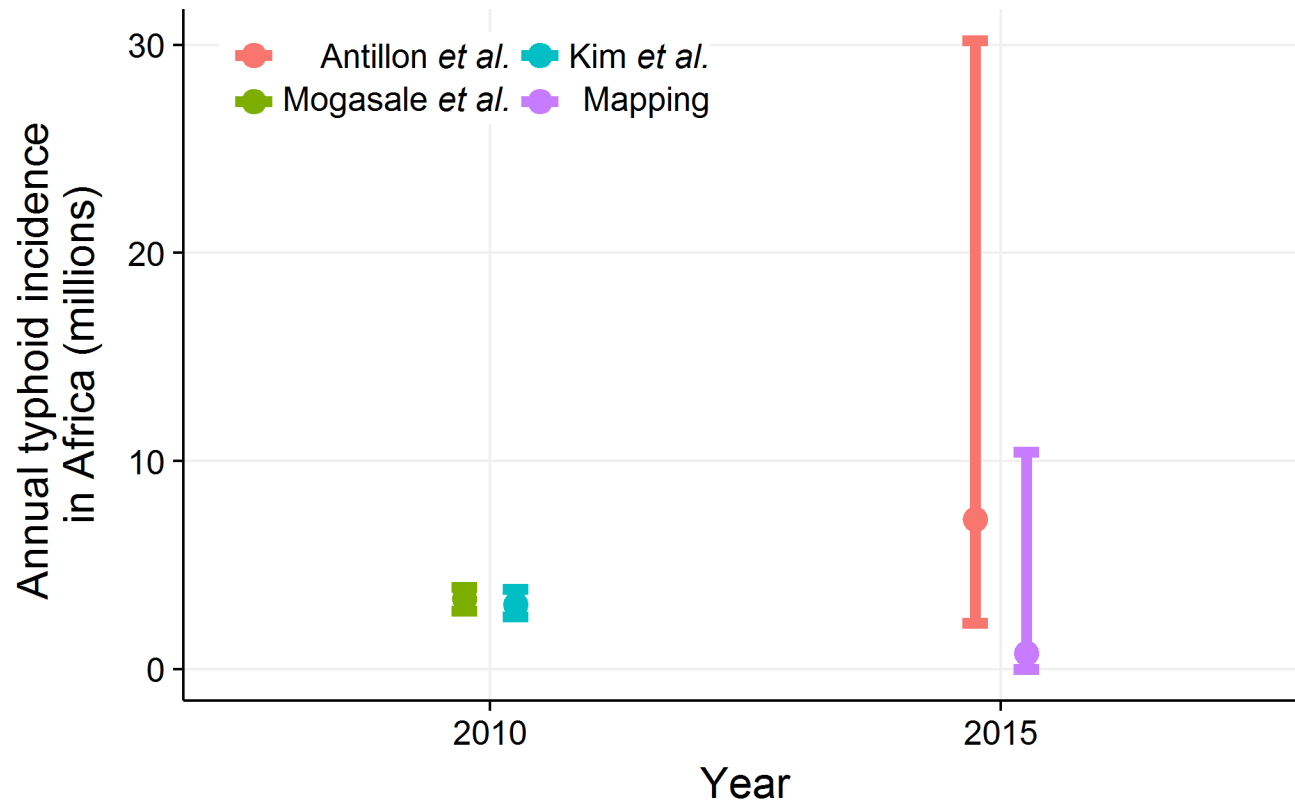

Pigott *et al.* (2014)

BRT model validation

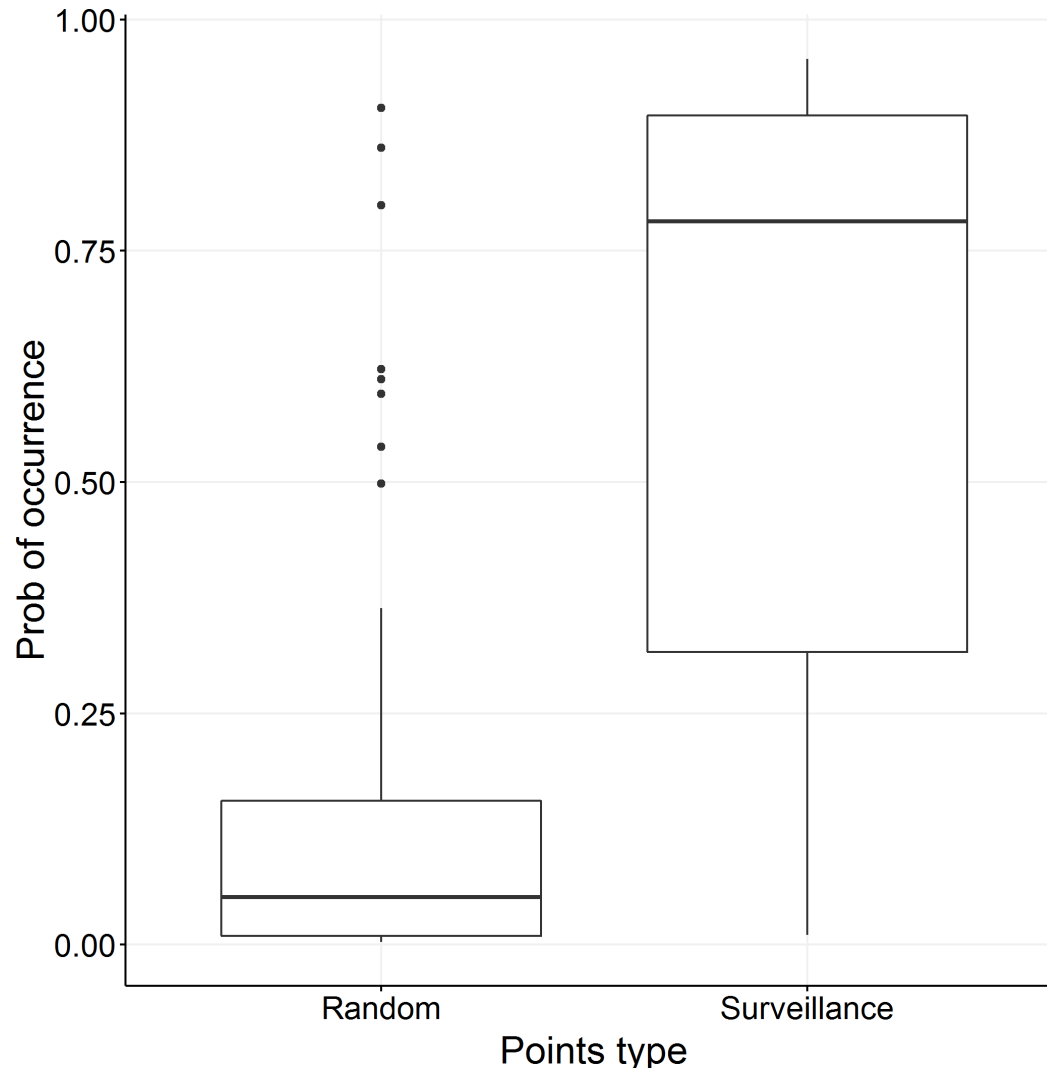

Comparison with the previous estimates

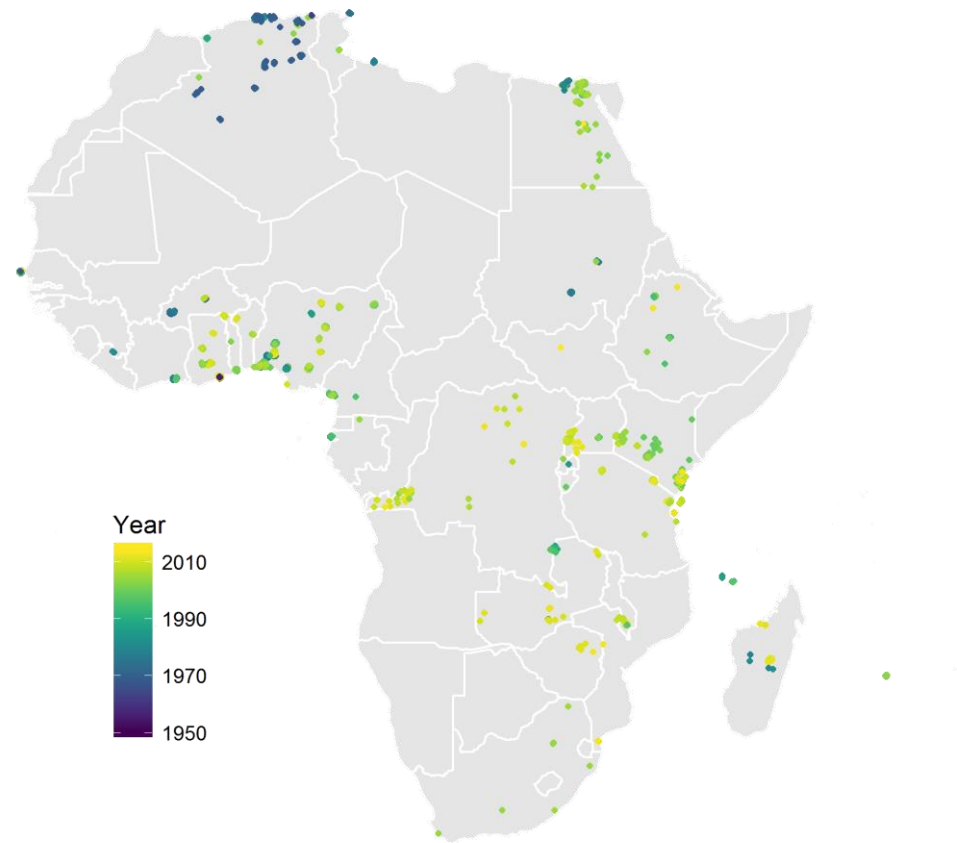

Estimates of typhoid burden already exist

Predicted probability of typhoid occurrence

Typhoid occurrences including clinically suspected (n=1523)

Surveillance sites are high-risk areas?
