

## Potential of typhoid conjugate vaccines in Uganda

Typhoid, a serious enteric fever spread through contaminated food and water, is a substantial public health issue that disproportionately impacts children and marginalized populations in Asia and sub-Saharan Africa. The Global Burden of Disease (GBD) study estimates that, in 2017, there were nearly 11 million typhoid cases and more than 116,000 typhoid deaths worldwide.<sup>1</sup> Additionally, strains of drug-resistant typhoid are spreading, causing global concern.<sup>2</sup>

### TYPHOID CONJUGATE VACCINES

Typhoid vaccination can reduce the need for antibiotics, slow expansion of drug-resistant strains, and save lives. Newly licensed and World Health Organization (WHO)-prequalified typhoid conjugate vaccines (TCVs) have several advantages over earlier typhoid vaccines. They:

- provide longer-lasting protection;
- require only one dose; and
- are suitable for young children over 6 months.

These qualities will allow better protection for younger children and expanded coverage through inclusion in routine childhood immunization programs.

### WHO RECOMMENDATION AND GAVI SUPPORT

In March 2018, WHO recommended that typhoid-endemic countries introduce prequalified TCVs into routine childhood immunization programs as a single dose for infants and children over 6 months of age, accompanied by catch-up vaccination campaigns for children up to 15 years of age, where feasible. Additionally, WHO recommended prioritizing countries with a high burden of disease and/or a growing burden of drug-resistant typhoid, and in response to confirmed typhoid outbreaks. Gavi, the Vaccine Alliance has earmarked US\$85 million to support the introduction of TCVs into routine immunization programs and is accepting applications for financial support, with introductions anticipated as soon as 2019.

### AN OPPORTUNITY FOR UGANDA

TCVs could have a substantial benefit in Uganda, where typhoid inflicts a significant public health burden. The GBD estimates that, in 2017, Uganda had:

- **56,135 typhoid cases** or **144 cases per 100,000 population**, 64 percent of which were among children under 15 years of age; and
- **657 typhoid deaths**, 71 percent of which were among children under 15 years of age.<sup>1</sup>

Typhoid likely also imposes an economic burden in Uganda. While costs of illness have not yet been evaluated for Uganda, analyses from other settings in sub-Saharan Africa have found that the average costs of a typhoid case borne by families can amount to two months of average family income.<sup>3</sup> Preliminary findings from an economic analysis predict that, even in the absence of a Gavi subsidy, a catch-up campaign followed by routine childhood immunization with TCVs would potentially be cost-effective in Uganda.<sup>4</sup>
