

# Vaccines take on drug-resistant typhoid

Drug-resistant typhoid is on the rise.  
Typhoid conjugate vaccines (TCVs) can slow its spread.

TCV introduction at any point can break the cycle of drug-resistant typhoid by preventing infections and stopping transmission.

It is only a matter of time until typhoid becomes **untreatable**, raising the **urgency for prevention** with proven interventions including TCVs. Expanded use of TCVs through routine immunization will allow children, their families, and communities to stay healthy, lessen the need for antibiotics, and slow the further emergence and spread of drug-resistant typhoid.
