Together We Can Take on Typhoid

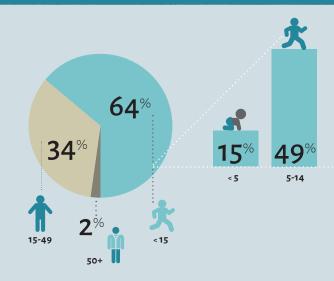

While typhoid is rarely fatal, the recovery is long and difficult. The disease steals time, money, and productivity from those infected and their families and is associated with numerous long-term complications.

Most typhoid cases in Benin occur in children younger than 15 years old.

TYPHOID CASES IN BENIN BY AGE (2019)

Drug-resistant typhoid strains are a growing problem in Benin, regionally, and across the globe.

Global data show that multidrugresistant (MDR) typhoid prevalence has increased dramatically since 1992.³

A study of 53 Salmonella Typhi isolates found that nearly 40% were multidrug-resistant and 25% had decreased susceptibility to ciprofloxacin, the preferred antibiotic treatment in the region.²

Drug-resistant typhoid is more difficult to treat and forces the use of more expensive and less readilyavailable treatment options.

Typhoid conjugate vaccines (TCVs) in Benin

The World Health Organization (WHO) recommends the introduction of prequalified TCVs be prioritized in countries with a high burden of typhoid disease or a high burden of drug-resistant typhoid. Support for introduction from Gavi, the Vaccine Alliance is available now. TCVs:

Are highly effective and safe for children as young as **6 months** of age;

Require a **single dose** to prevent 79-85% of typhoid cases in children;⁴

Offer strong protection for **at least 4 years**; and

Can be **co-administered** with measles-rubella and yellow fever vaccines.^{5,6}

Findings from an economic analysis predict that, even in the absence of a Gavi subsidy, a **catch-up campaign with TCV could be cost-effective in Benin**.⁷

Let's Take on Typhoid in Benin

- Typhoid is endemic in Benin, with more than **14,000** cases per year.
- Benin's burden of typhoid is most heavily borne by children **younger than 15** years of age.
- Data show an increase in drugresistant typhoid in Benin, regionally, and globally.
- **TCVs** are safe, effective, and WHO-recommended for routine immunization as part of a costeffective, integrated approach to typhoid prevention and control alongside safe water, sanitation, and hygiene interventions.

Gavi support for TCV introduction is available *now*.
